EDUCATION

Necmettin Erbakan Üniversitesi

Bilgisayar Mühendisliği

2019 - 2024

SKILLS

- Unity
- C#
- SOLID Principles
- Performance Optimization
- Editor Scripting
- Git
- Unity Netcode
- Firebase
- Multiplayer (Unity Netcode / Photon)
- Shader
- Creative Thinking
- Cross-disciplinary Workflow Understanding
- Team Collaboration
- Effective Communication
- Problem Solving
- Fast Prototyping
- Adaptability

ABOUT ME

I am a results-driven Mobile Game Developer with over 4 years of experience working with C# and Unity. My background in mobile game development has strengthened my ability to anticipate the needs of designers and artists, enabling smooth collaboration across disciplines. Beyond implementing gameplay features, I build editor tools and design modular systems that help teams work more efficiently and understand project structures with ease.

I prioritize clean, maintainable code and follow OOP and SOLID principles to ensure long-term project sustainability. I also have hands-on experience with performance optimization, multiplayer systems, and editor scripting. You can find detailed project examples and supportive tools on my **GitHub** profile.

WORK EXPERIENCE

Game Developer

07/2025 - 10/2025

BigPlayGames

- I worked as a Game Developer within a four-person team on mobile casual puzzle projects, where I was responsible for both development and Level Design.

Game Developer

05/2023 - 09/2023

Umuly - Çorum

- Developed and published casual games.
- Strengthened advanced Unity development skills.

Computer Engineer Intern

07/2022 - 10/2022

EL-Capitan Games - KONYA

Developed and iterated on rapid prototypes for core casual game mechanics using Unity.

Computer Engineer Intern

07/2021 - 06/2022

Entegre Yazılım - KONYA

- Applied SOLID principles for clean code.
- Managed MySQL databases and optimized queries.
- Improved algorithmic problem-solving skills.

HOBBIES

- Playing strategic and adventure games
- Learning new things
- Listening to personal development podcasts
- Solving puzzles
- Exploring new technologies

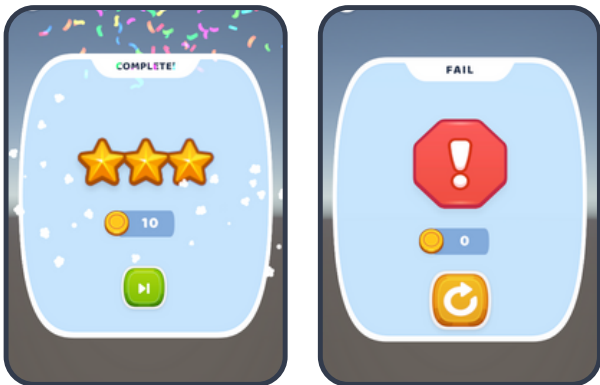

COLOR BLOCK JAM

- Built a full puzzle game with a SOLID-compliant, component-based architecture.
- Created all 3D assets in Blender 4.0 and developed a custom dissolve shader optimized via Material Property Blocks.
- Implemented key gameplay systems: drag-and-drop, obstacle detection, color matching, and auto-snap grid logic.
- Extended my custom framework (SerapKeremGameKit) with object pooling, state management, and a scalable level structure.

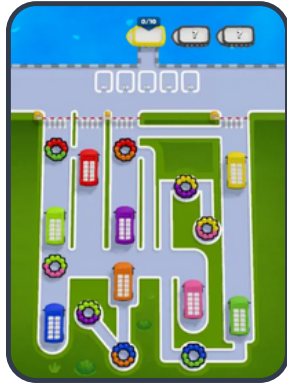

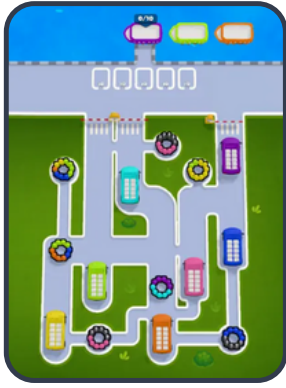

SERAPKEREMGAMEKIT — UNITY GAME BOILERPLATE

- Built a modular Unity boilerplate for rapid prototyping and scalable production.
- Implemented core reusable systems (audio, haptics, particles, UI, input) following SOLID principles.
- Designed pooled audio and particle managers to improve runtime performance.
- Created a DOTween-based UI panel system with automatic fade animations and feedback hooks.
- Developed a secure CurrencyWallet using signed PlayerPrefs storage.
- Added lightweight state and level management for flexible game flow control.
- Provided ready-to-use manager prefabs and a sample scene to accelerate new project setup.

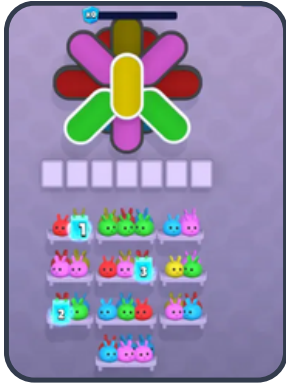

BUS CHASE PUZZLE

ROLE: I managed the end-to-end level design process, focusing on optimizing gameplay flow and player experience. I developed a code-based level generator system to automate core layout creation, while collaborating with the team on final design adjustments. Additionally, I contributed to the production of marketing content (videos and store images) and fine-tuned track/level pacing to ensure the product was player-ready and commercially viable.

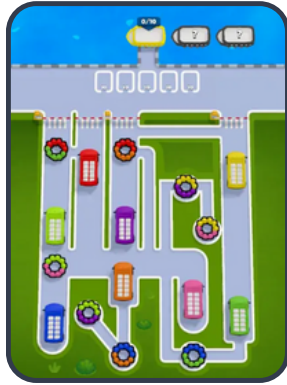

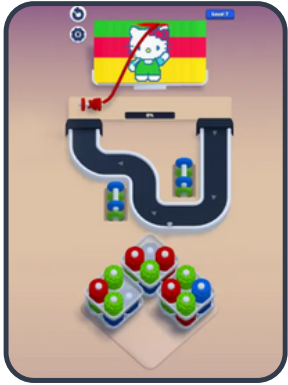

THREAD ROLLER

ROLE: I was responsible for designing and implementing engaging levels from concept to completion. This involved close collaboration with programmers and artists to build necessary tools and features. My primary focus was on optimizing gameplay flow, integrating level assets, and leveraging editor tools to streamline the level creation process.

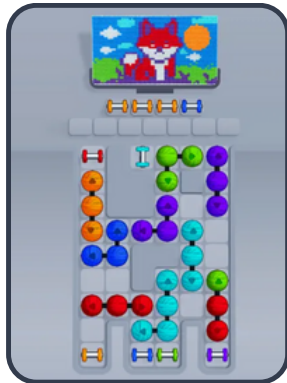

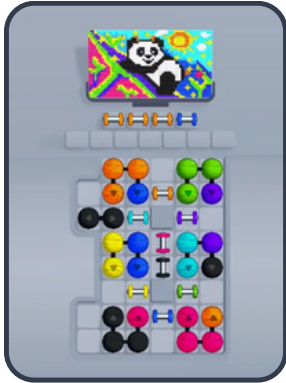

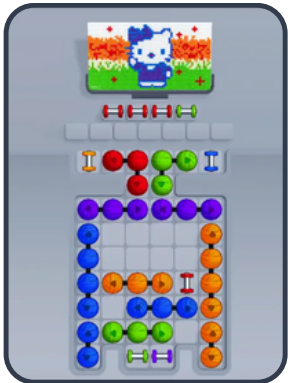

STICH N LOOP

ROLE: I was responsible for the entire codebase of the project from its inception, collaborating directly with level designers and artists to build the necessary tools and features. My main area of focus was on editor scripting to streamline the creative workflow.

TANGLE PULLER

ROLE: I managed the end-to-end level design process, focusing on optimizing gameplay flow and player experience. I developed a code-based level generator system to automate core layout creation, while collaborating with the team on final design adjustments. Additionally, I contributed to the production of marketing content (videos and store images) and fine-tuned track/level pacing to ensure the product was player-ready and commercially viable.

FOREST HOLE ADVENTURE

Game Features:

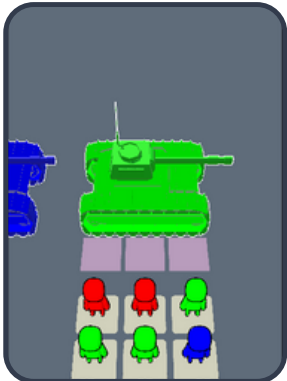

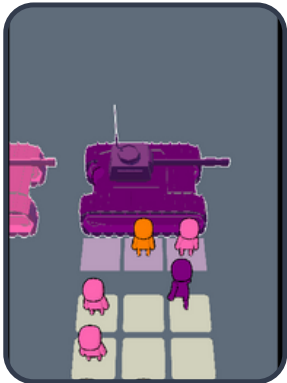

- Hole grows and consumes objects using shaders.
- Smooth movement powered by NavMesh with joystick and keyboard support.
- Animals roam the map and try to escape from the hole.
- Dynamic camera tracking using Cinemachine.
- Level customization with ScriptableObjects for target score, time, and object properties.

Technologies Used:

Unity, C#, DOTween, Cinemachine, NavMesh, SerapkeremGameTools, TrilInspector.

STICKMAN TANK RUSH

Developed a hyper-casual puzzle game.

Technologies Used:

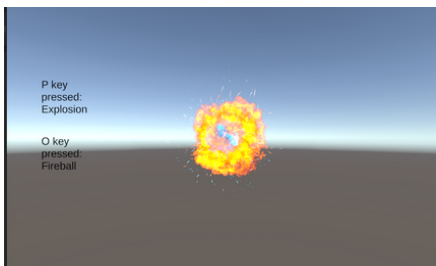

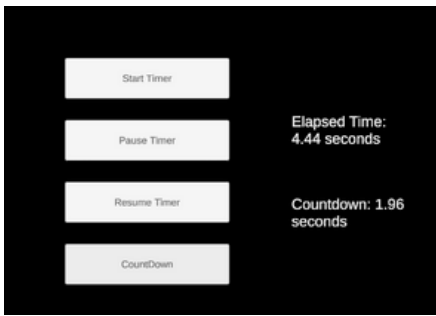

Unity, C#, DOTween, Array2D, ColorType, GridPathfinder, TrilInspector, SerapkeremGameTools.

Key Features:

- Color matching mechanics for tank and stickman interactions.
- Grid-based dynamic pathfinding and movement system.
- Level designs created using ScriptableObjects.
- Minimalist and user-friendly interface.
- Optimized for mobile devices.

SerapKeremGameTools

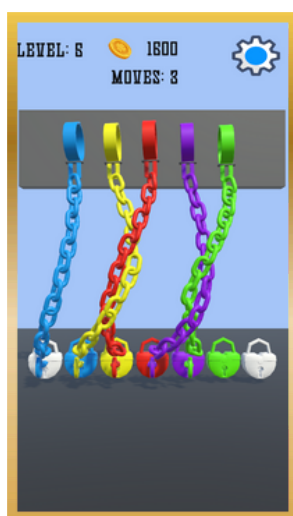

I A modular Unity package offering reusable components and tools for optimized game development.

- Singleton System: MonoSingleton & NonMonoSingleton for global instance management.
- AudioManager: Simplified sound pooling and control.
- ParticleManager: Efficient particle effect pooling and customization.
- TimeManager: In-game time control with pause and countdown features.
- InputManager: Mouse input and object interaction management.
- ObjectPool: Performance-focused object reuse system.
- SaveLoadSystem: Easy game state persistence with PlayerPrefs.
- FPSCharacterSystem: Movement, interaction, and health management for FPS games.

COLOR CHAINS

- ColorChains – Logic-Based Puzzle Game
- ColorChains is a strategic puzzle game where players must place keys into the correct sockets while managing chain constraints. The challenge is to avoid breaking the chains and complete the level within the move limit.
- ♦ Physics-Based Chain Mechanics
- ♦ Key & Socket Matching System
- ♦ Limited Moves for Strategic Planning
- Developed using Unity, C#, DOTween, TrilInspector, and SerapkeremGameTools.

Third Person Multiplayer Shooter

- Multiplayer Support: Real-time multiplayer battles powered by Unity Netcode.
- Third-Person Perspective: Dynamic third-person camera for a wider battlefield view.
- Weapon Switching: Switch between multiple weapons for adaptable combat strategies.
- Ammo & Health Systems: Realistic ammo and health management for strategic depth.
- Inventory Collection: Collect items like weapons and health packs for survival.
- Character Selection: Choose from a roster of visually unique characters with similar abilities.
- NPC Characters: Non-player characters add challenges and immersive elements.

Technologies Used: Unity, C#, Unity Netcode.

GTA Clone

In this game, smooth character movements and animations enhance realism. A weapon and inventory system allows item usage, while NPCs roam randomly, adding dynamism. Drivable vehicles with realistic mechanics are featured, and a wanted level system triggers police responses based on the player's crimes. Missions, a map system, and save/load functionality support exploration and progress.
